

Chapter 11 - Dynamic Memory Allocation

C is a language with some fixed rules of programming. For example: changing the size of an array is not allowed.

Dynamic Memory Allocation

Dynamic memory allocation is a way to allocate memory to a data structure during the runtime. We can use DPA functions available in C to allocate and free memory during runtime.

Functions for DMA in C

Following functions are available in C to perform Dynamic memory Allocation :

- | | |
|----|-----------|
| 17 | malloc() |
| 27 | calloc() |
| 37 | free() |
| 47 | realloc() |

malloc() function

malloc stands for memory allocation. It takes number of bytes to be allocated as an input and returns a pointer of type void.

Syntax:

$\text{ptr} = (\text{int}^*) \text{malloc}(30 \times \text{sizeof}(\text{int}))$

✓
Casting void
pointer to int

Space for
30 ints

↳ returns size of 1 int

The expression returns a null pointer if the memory cannot be allocated.

Quick Quiz: Write a program to create a dynamic array of 5 floats using malloc().

calloc() function

calloc stands for continuous allocation.

It initializes each memory block with a default value of 0.

Syntax:

```
ptr = (float*) calloc(30, sizeof(float));
```

Allocates contiguous space in memory for 30 blocks (floats)

If the space is not sufficient, memory allocation fails and a NULL pointer is returned.

Quick Quiz: Write a program to create an array of size n using calloc where n is an integer entered by the user.

free() function

We can use free() function to de-allocate the memory.

The memory allocated using calloc/malloc is not deallocated automatically.

Syntax :

`free(ptr);` \Rightarrow Memory of `ptr` is released.

Quick Quiz: Write a program to demonstrate the usage of `free()` with `malloc()`.

`realloc()` function

Sometimes the dynamically allocated memory is insufficient or more than required.

`realloc` is used to allocate memory of new size using the previous pointer and size.

Syntax :

`ptr = realloc(ptr, newSize);`

`ptr = realloc(ptr, 3 * sizeof(int));`

`ptr` now points to this new block of memory capable of storing 3 integers.

Chapter 11 - Practice Set

- 1 Write a program to dynamically create an array of size 6 capable of storing 6 integers.
- 2 Use the array in problem 1 to store 6 integers entered by the user.
- 3 Solve problem 1 using `calloc()`.
- 4 Create an array dynamically capable of storing 5 integers. Now use `realloc` so that it can now store 10 integers.
- 5 Create an array of multiplication table of 7 up to 10 ($7 \times 10 = 70$). Use `realloc` to make it store 15 numbers (from 7×1 to 7×15).
- 6 Attempt problem 4 using `calloc()`.
