Chapter 3 - Conditional Instructions

Sometimes we want to watch comedy videos on YouTube if the day is Sunday.
Sometimes we order junk food if it is our friend's birthday in the hostel.
You might want to buy an Umbrella if its raining and you have the money.
You order the meal if dal or your favorite bhindi is listed on the menu.

All these are decisions which depends on a condition being met.
In C language too, we must be able to execute instructions on a condition(s) being met.

Decision Making Instructions in C
→ If - else Statement
→ Switch Statement

If - else Statement
The syntax of an If - else statement in C looks like:

```
if (condition to be checked) {
        Statements - if - condition - true;
}
else {
        Statements - if - condition - false;
}
```

Code example:

```
int a = 23;

if (a > 18) {
    printf (" You can drive \n");
}
```

Note that else block is not necessary but optional.

Relational Operators in C

Relational operators are used to evaluate conditions (true or false) inside the if Statements. Some examples of relational operators are :-

$==$, $>=$, $>$, $<$, $<=$, $!=$

↓   ↓   ↓

equals   greater than or equal to   not equal to

Important note :- '=' is used for assignment where as '==' is used for equality check.

The condition can be any valid expression. In C a non-zero value is considered to be true.

Logical Operators

&&, || and ! are three logical operators in C
These are read as "AND", "OR" and "NOT"
They are used to provide logic to our C programs

Usage of Logical Operators:

(i) && → AND → is true when both the conditions
are true

"1 and 0" is evaluated as false.
"0 and 0" is evaluated as false.
"1 and 1" is evaluated as true.

(ii) || → OR → is true when at least one of the
conditions is true. (1 or 0 → 1) (1 or 1 → 1)

(iii) ! → returns true if given false and false if
given true

!(3 == 3) → evaluates to false
!(3 > 30) → evaluates to true.

As the number of conditions increases, the level
of indentation increases. This reduces readability.
Logical operators come to rescue in such cases.

else if clause
Instead of using multiple if statements, we can also
use else if along with if thus forming an if-else if-
else ladder.

```
if {
// Statements;
}
else if {
...
}
else {...
}
```

Using if - else if - else reduces indents
The last "else" is optional
Also there can be any number of "else if"

Last else is executed only if all conditions fail.

Operator precedence

Priority	Operator
1st	!
2nd	*, /, %
3rd	+, -
4th	< >, <=, >=
5th	==, !=
6th	&&
7th	||
8th	=

Conditional Operators

A short hand "if - else" can be written using the Conditional or ternary operators

Condition ? expression - if - true : expression - if - false

Ternary operators

Switch Case Control Instruction

Switch - Case is used when we have to make a choice between number of alternatives for a given variable.

```
Switch ( integer - expression )
{
    Case C1:
        Code;

    Case C2:
        code;

    Case C3:
        code;

    default:
        Code;
}
```

$C_1, C_2 \& C_3 \rightarrow$ Constants

Code $\rightarrow$ Any valid C code.

The value of integer - expression is matched against C_1, C_2, C_3 .... If it matches any of these Cases, that case along with all subsequent "Case" and "default" Statements are executed.

* **Quick Quiz:** Write a program to find grade of a student given his marks based on below:

→ 90 - 100 → A   → < 70 → F.

→ 80 - 90 → B

→ 70 - 80 → C

→ 60 - 70 → D

Important Notes

1> We can use switch-case statements even by writing cases in any order of our choice (not necessarily ascending)

2> char values are allowed as they can be easily evaluated to an integer

3> A switch can occur within another but in practice this is rarely done.

1. What will be the output of this program

```
int a = 10;
if (a = 11)
    printf (" I am 11");
else
    printf (" I am not 11");
```

2. Write a program to find out whether a student is pass or fail; if it requires total 40% and at least 33% in each subject to pass. Assume 3 subjects and take marks as an input from the user.

3. Calculate income tax paid by an employee to the Government as per the slabs mentioned below:

Income Slab	Tax
2.5 L - 5.0 L	5%
5.0 L - 10.0 L	20%
Above 10.0 L	30%

Note that there is no tax below 2.5 L. Take income amount as an input from the user.

4. Write a program to find whether a year entered by the user is a leap year or not. Take year as an input from the user.

5. Write a program to determine whether a character entered by the user is lowercase or not.

6. Write a program to find greatest of four numbers entered by the user.
